

arco clip hook

the hip alternative

Revised mk3 version (2016)

Thank you for purchasing the Arco Clip Hook (mk 3).

The hook itself is lined with braided tubing and a top layer of rubber sleeving*, helping to protect your bow.

Please note that the Arco Clip Hook is specifically and only intended to securely support the weight of a bow. The following advice should ensure it serves you faithfully and well.

(* Previous versions: braid only partially covered in rubber sleeving)

Precautionary information about the barrel/strap-hinge assembly:

The mk3 ACH has the hook secured into the barrel/strap-hinge with a simple screw thread. Please refrain from screwing/unscrewing the hook, as this may introduce wear and play, so loosening the hook.

Because of the potential for an accidental knock on the hook, the plastic retaining straps purposely allow a little 'play' at the hinge end, so the hook can move slightly out of it's central alignment (pics 1 & 2), so helping absorb the shock of an accidental impact.

Happy bowing and plucking!

Steve Berry (*inventor and rights holder*).
